Radicals that are "like radicals" can be added or subtracted by adding or subtracting the coefficients. 1. Break down the given radicals and simplify each term. 2. Identify the like radicals. 3. Add or subtract the like radicals by adding or subtracting their coefficients. Examples: 1.  $4\sqrt{5} + 3\sqrt{5}$  2.  $-3\sqrt{75} - \sqrt{27}$ . Show Step-by-step Solutions

Simplify:  $2\sqrt{3} + 3\sqrt{3}$ . Since the radical is the same in each term (being the square root of three), then these are "like" terms. This means that I can combine the terms. Content Continues Below.

The questions in these pdfs contain radical expressions with two or three terms. They incorporate both like and unlike radicands. Use prime factorization method to obtain expressions with like radicands and add or subtract them as indicated. Further, get to intensify your skills by performing both the operations in a single question.

The radicands and indices are the same, so these two radicals can be combined.  $5\sqrt{13} - 3\sqrt{13} = 2\sqrt{13}$ . Example. Subtract.  $4\sqrt{5a} - 3\sqrt{3a} - 2\sqrt{5a} = 4\sqrt{5a} - 3\sqrt{3a} - 2\sqrt{5a} = 2\sqrt{5a} - 3\sqrt{3a}$ . Show Solution. Two of the radicals have the same index and radicand, so they can be combined.

To add or subtract radicals the must be like radicals. Like radicals have the same root and radicand. Examples of like radicals are:  $(\sqrt{2}, 5\sqrt{2}, -4\sqrt{2})$  or  $(\sqrt[3]{15}, 2\sqrt[3]{15}, -9\sqrt[3]{15})$  Simplify:  $(3\sqrt{2} + 2\sqrt{2})$  The terms in this expression contain like radicals so can therefore be added.

There are two keys to combining radicals by addition or subtraction: look at the index, and look at the radicand. If these are the same, then addition and subtraction are possible. If not, then you cannot combine the two radicals. Making sense of a string of radicals may be difficult.

**Adding, Subtracting, Multiplying Radicals**  
We add and subtract like radicals in the same way we add and subtract like terms. We know that  $3x + 8x$  is  $11x$ . Similarly we add  $3\sqrt{x} + 8\sqrt{x}$  and the result is  $11\sqrt{x}$ . Think about adding like terms with variables as you do the next few examples. When you have like radicals, you just add or subtract the coefficients.

 $\sqrt{12x^5} = 2x^2\sqrt{3x}$   $\sqrt{18x} = 3\sqrt{2x}$   $\sqrt{300x^5} = 10\sqrt{3x}$   $\sqrt{98x} = 7\sqrt{2x}$ . Now you can combine the  $\sqrt{2x}$  with each other and the  $\sqrt{3x}$  with each other, but you can't combine them together.

When adding terms with like radicals, add only the coefficients; the radical part remains the same. Example 1: Add:  $3\sqrt{2} + 2\sqrt{2}$ . . Solution: The terms contain like radicals; therefore, add the coefficients. Answer:  $5\sqrt{2}$ . 5 2. Subtraction is performed in a similar manner. Example 2: Subtract:  $2\sqrt{7} - 3\sqrt{7}$ .

**Adding and Subtracting Radical Expressions**  
To add and subtract square roots, you need to combine square roots with the same radical term. This means that you add or subtract  $2\sqrt{3}$  and  $4\sqrt{3}$ , but not  $2\sqrt{3}$  and  $2\sqrt{5}$ . There are many cases where you can actually simplify the number inside the radical to be able to combine like terms and to freely add and subtract square roots. Part 1
