The equation for
the arc length
is this: Central
angle/360 = Arc
length/

Circumference.

Since the radius
is four the
circumference

File Type PDF

will be eight.

The equation is

$$104 / 360 =$$

$s/8\pi$. Multiply

both sides by 8

π since we need

to isolate s ,

and you should

end up with the

answer which is

$$104 * 8\pi / 360 =$$

s . Hope this

Arc Length and

Area of a Sector

If we are

working with

File Type PDF

relatively small central angles in circles with large radii, we can use the length of the intercepted arc to approximate the length of the associated chord. For example, Figure 5 shows a central angle of

File Type PDF

Arc Length

1° in a circle of radius 1,800 feet, along with the arc and chord cut off by 1° .

Arc Length and
Area of a Sector
One radian is defined as the angle formed such that the portion of the

File Type PDF

Arc Length

circle (or arc length) swept by that angle is equal to the radius of the circle. Another way to look at it is this: if we took a segment of length r (the radius) and molded it onto the circle, the

File Type PDF

Arc Length

angle formed by the radii connecting the center of the circle to the endpoints of the arc would have a measure of 1 radian.
