derivative present in the equation. Linear or nonlinear. A second order ODE is said to be linear if it can be written in the form  $a(t) \frac{d^2y}{dt^2} + b(t) \frac{dy}{dt} + c(t)y = f(t)$ , (1.8) where the coefficients  $a(t)$ ,  $b(t)$  &  $c(t)$  can, in general, be functions of  $t$ . An equation that is not linear is said to be nonlinear. Note

## Applied Linear Algebra and Differential Equations

Until the 19th century, linear algebra was introduced through systems of linear equations and matrices. In modern mathematics, the presentation through vector spaces is generally preferred, since it is more synthetic, more general (not limited to the finite-dimensional case), and conceptually simpler, although more abstract.. A vector space over a field  $F$  (often the field of the real numbers ...
