The launch of Sputnik in 1957 not only began the space age, it also showed that Soviet rockets were more powerful than American ones. Within months, the US Air Force hired Rocketdyne for a feasibility study of an engine capable of delivering at least 1 million pounds of thrust. Later, NASA ran the development of this F-1 engine in order to use it to power the first stage of the Saturn V rocket that would send Apollo missions to the Moon. It is no exaggeration to say that without the F-1 engine NASA would not have been able to achieve President Kennedy's 1961 challenge to his nation to land a man on the Moon before the decade was out.

In 1961, Pres. John F. Kennedy set the challenge of landing a man on the moon by the end of the decade. In order to achieve this, NASA partnered with US industry to build the largest rocket ever produced, the Saturn V. It was designed and tested in record time and made its first flight in 1967. Less than two years later and within the timescales set by the president, the crew of Apollo 11 was launched on a Saturn V and watched live by millions of people on televisions around the world. From this launch, Neil Armstrong made his famous giant leap for mankind, later to be followed by 11 other astronauts who also walked on the moon.

In a whimsical automotive reference, the hosts of the zany NPR series Car Talk answer one hundred frequently asked questions about all kinds of vehicle conundrums in their own anecdotal style. Original.
