Membrane processes cover a group of separation processes in which the characteristics of a membrane (porosity, selectivity, electric charge) are used to separate the components of a solution or a suspension. In these processes the feed stream is separated into two: the fraction that permeates through the membrane, called the permeate, and the fraction containing the components that have not ...

Mulder, M.—1996-Basic-Principles-Of-Membrane-Technology,—2—

Basic Principles. Electrodialysis (ED) is a membrane separation process that utilizes an electrical potential difference as a driving force for moving salt ions in solutions. The membrane is selective in that it'll only permit the passage of either anions or cations but not both.Thus separation is due to charge rather than size differences. . This process can be used to separate differently ...
