Hip fractures are usually treated in hospital with surgery. Most people will need surgery to fix the fracture or replace all or part of their hip, ideally on the same day they're admitted to hospital, or the day after. There are different operations, which are described below. The type of surgery you have will depend on:

This open access book aims to provide a comprehensive but practical overview of the knowledge required for the assessment and management of the older adult with or at risk of fragility fracture. It considers this from the perspectives of all of the settings in which this group of patients receive nursing care. Globally, a fragility

Fractures is estimated to occur every 3 seconds. This amounts to 25 000 fractures per day or 9 million per year. The financial costs are reported to be: 32 billion EUR per year in Europe and 20 billion USD in the United States. As the population of China ages, the cost of hip fracture care there is likely to reach 1.25 billion USD by 2020 and 265 billion by 2050 (International Osteoporosis Foundation 2016).

Consequently, the need for nursing for patients with fragility fracture across the world is immense.

Fragility fracture is one of the foremost challenges for

Fractures health care providers, and the impact of each one of those expected 9 million hip fractures is significant pain, disability, reduced quality of life, loss of independence and decreased life expectancy. There is a need for coordinated, multi-disciplinary models of care for secondary fracture prevention based on the increasing evidence that such models make a difference. There is also a need to promote and facilitate high quality, evidence-based effective care to those who suffer a fragility fracture with a focus on the best outcomes for recovery, rehabilitation

Fractures and secondary prevention of further fracture. The care community has to understand better the experience of fragility fracture from the perspective of the patient so that direct improvements in care can be based on the perspectives of the users. This book supports these needs by providing a comprehensive approach to nursing practice in fragility fracture care.

This book focuses on orthogeriatrics, a topic that has received little attention in the literature to date. As active members of the Fragility Fracture Network (FFN), the editors

Fractures and most of the authors of this book have gathered all essential expertise on hip fracture management in a single volume. The 14 chapters provide a complete overview of how to approach fractures in elderly patients, starting with the epidemiology of hip fractures and subsequently addressing osteoporosis, surgery, anesthesia, medical management of frailty, and peri-operative complications. Attention is also given to rehabilitation and nursing, as well as to the psychological evaluation of the patient and the caregivers, thus emphasizing the importance of a
